# Introduction to Topic Models 

Vivi Nastase

Summer semester 2012
ICL, University of Heidelberg

## Course plan

Scheduling:

- Lecture: Thursdays, 14-16, here
- Office hours: Thursdays, 11-12 (Room 121)
- e-mail: nastase@cl.uni-heidelberg.de

Work:

- attend the lectures, and interact - bring pens and papers! I will rarely have slides
- a semester long project
- present and discuss an assigned paper
- oral exam

## Goals

- understand the mathematical formalism behind topic models
- figure out the strengths and weaknesses of this type of approaches (the hunting joke is true!)
- look at some of the more interesting extensions of the vanilla LDA
- give you hands on experience in developing a topic model

## Project: LDA with your favourite extension

Homework 1, due date May $17^{\text {th }}$ :

- pick your favourite text collection from the ICL's resources
- implement a system that splits the input data into fragments (sentences / paragraphs/ documents) - this should be a parameter
- represent the data in a structure that matches the split
- send me an archive with your code and documentation by May $17^{\text {th }}$

Why topic models?

## Topic models

from David Blei, KDD-11 tutorial

- Observation: a collection of texts
- Assumption: the texts have been generated according to some model
- Output: the model that has generated the texts

## Topic models

- Discover hidden topical patterns that pervade the collection through statistical regularities
- Annotate documents with these topics
- Use the topic annotations to organize, summarize, search texts ...

## Topic examples

Topic 247

| word | prob. |
| ---: | :--- |
| DRUGS | .069 |
| DRUG | .060 |
| MEDICINE | .027 |
| EFFECTS | .026 |
| BODY | .023 |
| MEDICINES | .019 |
| PAIN | .016 |
| PERSON | .014 |
| MARIJUANA | .014 |
| LABEL | .012 |
| ALCOHOL | .012 |
| DANGEROUS | .011 |
| ABUSE | .009 |
| EFFECT | .009 |
| KNOWN | .008 |
| PILLS | .008 |

Topic 5

| word | prob. |
| ---: | :--- |
| RED | .202 |
| BLUE | .099 |
| GREEN | .096 |
| YELLOW | .073 |
| WHITE | .048 |
| COLOR | .048 |
| BRIGHT | .030 |
| COLORS | .029 |
| ORANGE | .027 |
| BROWN | .027 |
| PINK | .017 |
| LOOK | .017 |
| BLACK | .016 |
| PURPLE | .015 |
| CROSS | .011 |
| COLORED | .009 |

Topic 43

| word | prob. |
| ---: | ---: |
| MIND | .081 |
| THOUGHT | .066 |
| REMEMBER | .064 |
| MEMORY | .037 |
| THINKING | .030 |
| PROFESSOR | .028 |
| FELT | .025 |
| REMEMBERED | .022 |
| THOUGHTS | .020 |
| FORGOTTEN | .020 |
| MOMENT | .020 |
| THINK | .019 |
| THING | .016 |
| WONDER | .014 |
| FORGET | .012 |
| RECALL | .012 |

Topic 56

| word | prob. |
| ---: | ---: |
| DOCTOR | .074 |
| DR. | .063 |
| PATIENT | .061 |
| HOSPITAL | .049 |
| CARE | .046 |
| MEDICAL | .042 |
| NURSE | .031 |
| PATIENTS | .029 |
| DOCTORS | .028 |
| HEALTH | .025 |
| MEDICINE | .017 |
| NURSING | .017 |
| DENTAL | .015 |
| NURSES | .013 |
| PHYSICIAN | .012 |
| HOSPITALS | .011 |

Figure 1. An illustration of four (out of 300 ) topics extracted from the TASA corpus.

## LSA and topic models

## Topic models - intuition

## Seeking Life's Bare (Genetic) Necessities

ing. Cold Spring Harbor, New York May 8 to 12 .

SCIENCE • VOL 272 • 24 MAY 1996

- Find the latent structure of "topics" or "concepts" in a text corpus, which is obscured by "word choice" noise
- Deerwester et al (1990) - LSA - co-occurrence of terms in text documents can be used to recover this latent structure, without additional knowledge.
- Latent topic representations representations of text allow modelling linguistic phenomena, like synonymy and polysemy.

## Topic models

Documents
Topic proportions and assignments

Each document is a mixture of topics:

$$
\sum_{k} p\left(z_{m}=k\right)=\sum_{k} \theta_{m, k}=1
$$

Each word is drawn from one of its document's topics:

$$
p\left(w_{m, n}\right)=\sum_{k} p\left(w_{m, n} \mid z_{m, n}=k\right) p\left(z_{m, n}=k\right)=\sum_{k} \varphi_{k}\left(w_{m, n}\right) \theta_{m, k}
$$

## Topic models

The observations are the documents: $\mathbf{w}_{\mathbf{m}}, m \in 1, M$
We need to infer the model, i.e the underlying topic structure, i.e. the topic assignments $z_{m, n}$, the topic $\theta_{m}, \quad m \in 1, M$ and word distributions $\varphi_{k}, \quad k \in 1, K$

## Priors:

$\theta \sim$ distribution with hyperparameter $\alpha$
$\varphi \sim$ distribution with hyperparameter $\beta$

## Topic models - Latent Dirichlet Allocation

$$
\begin{gathered}
p(\theta \mid \alpha)=\frac{1}{B(\alpha)} \prod_{k} \theta_{k}^{\alpha_{k}-1} \\
\sum_{k} \theta_{m, k}=1
\end{gathered}
$$

$\alpha$ controls the mean shape and sparsity of $\theta$
The topic proportions $\left(\theta_{m}\right)$ are a K-dimensional Dirichlet $z_{m, n}$ are multinomial distributions from $\theta_{m}$

$$
p\left(z_{m, n} \mid \theta_{m}\right)=\frac{N!}{\prod_{k=1}^{K} n_{k}!} \prod_{k=1}^{K} \theta_{m, k}^{n_{k}}
$$

## Topic models - Latent Dirichlet Allocation

$$
\begin{gathered}
p(\varphi \mid \beta)=\frac{1}{B(\beta)} \prod_{v} \varphi_{v}^{\beta_{v}-1} \\
\sum_{v} \varphi_{k, v}=1
\end{gathered}
$$

$\beta$ controls the mean shape and sparsity of $\varphi$
The topics $\left(\varphi_{k}\right)$ are a V-dimensional Dirichlet $w_{m, n}$ are multinomial distributions from $\varphi_{z_{m, n}}$

$$
p\left(w_{m, n} \mid \varphi_{k}\right)=\frac{V!}{\prod_{v=1}^{V} n_{v}!} \prod_{v=1}^{V} \varphi_{k, v}^{n_{v}}
$$

## Topic models - inference via Gibbs sampling

$$
p\left(x=1 \mid \mathcal{O}, \alpha_{h}, \alpha_{t}\right)=\frac{p\left(x=1, \mathcal{O} \mid \alpha_{h}, \alpha_{t}\right)}{p\left(\mathcal{O} \mid \alpha_{h}, \alpha_{t}\right)}=\frac{n_{h}+\alpha_{h}}{N+\alpha_{h}+\alpha_{t}}
$$

## Topic examples

"Theoretical Physics"

"Neuroscience"

## Topic examples

Object $\equiv$ bag of words with labels

## Topic examples

Basic components:

- A set of entities (e.g. documents, images, individuals, genes)
- A set of relations (e.g. citation, coauthor, co-tag, friends, pathways)

## Topic models in machine learning

- generative - assume an underlying model (probability distribution, parameters) generated the observed data
- the class is a hidden variable
- can handle a large number of classes
- difference relative to discriminative models?

## Topic models in machine learning

- generative - assume an underlying model (probability distribution, parameters) generated the observed data
- the class is a hidden variable
- can handle a large number of classes
- difference relative to discriminative models?

$$
\begin{aligned}
& \text { discriminative: } P(Y \mid X) \\
& \text { generative: } P(Y, X)
\end{aligned}
$$

## Probabilities refresher

probability/probable
late 14c., from O.Fr. probable (14c.), from L. probabilis "provable," from probare "to try, to test"

Wahrsheinlichkeit/wahrsheinlich
seems to be true

## Probabilities refresher

An experiment whose outcome depends on chance random variable $\mathbf{X}$ captures the outcome of the experiment sample space $S$ the set of all possible outcomes event $E \subseteq S$

X can be
discrete if $S$ is finite or countably infinite continuous

Examples?

## Distributions and probabilities

The distribution function:

$$
\begin{gathered}
p: S \rightarrow[0,1] \\
p(x) \geq 0, \forall x \in S \\
\sum_{x \in S} p(x)=1
\end{gathered}
$$

## Distributions and probabilities

The distribution function:

$$
\begin{gathered}
p: S \rightarrow[0,1] \\
p(x) \geq 0, \forall x \in S \\
\sum_{x \in S} p(x)=1
\end{gathered}
$$

Probability of an event:

$$
\begin{gathered}
P(E)=\sum_{x \in E} p(x) \\
P(\{x\})=p(x)
\end{gathered}
$$

## A bit of practice

1. dice rolling
2. tossing two coins

## Properties of probabilities

$$
P(E) \geq 0, \forall E \subseteq S
$$

## Properties of probabilities

$$
\begin{gathered}
P(E) \geq 0, \forall E \subseteq S \\
P(S)=1
\end{gathered}
$$

## Properties of probabilities

$$
\begin{gathered}
P(E) \geq 0, \forall E \subseteq S \\
P(S)=1 \\
E \subset F \subset S \rightarrow P(E) \leq P(F)
\end{gathered}
$$

## Properties of probabilities

$$
\begin{gathered}
P(E) \geq 0, \forall E \subseteq S \\
P(S)=1 \\
E \subset F \subset S \rightarrow P(E) \leq P(F) \\
E \cap F=\emptyset \rightarrow P(E \cup F)=P(E)+P(F)
\end{gathered}
$$

## Properties of probabilities

$$
\begin{gathered}
P(E) \geq 0, \forall E \subseteq S \\
P(S)=1 \\
E \subset F \subset S \rightarrow P(E) \leq P(F) \\
E \cap F=\emptyset \rightarrow P(E \cup F)=P(E)+P(F) \\
P(\overline{\mathrm{E}})=1-P(E)
\end{gathered}
$$

## Properties of probabilities

$$
\begin{gathered}
P(E) \geq 0, \forall E \subseteq S \\
P(S)=1 \\
E \subset F \subset S \rightarrow P(E) \leq P(F) \\
E \cap F=\emptyset \rightarrow P(E \cup F)=P(E)+P(F) \\
P(\overline{\mathrm{E}})=1-P(E)
\end{gathered}
$$

Proofs?

## Examples of probabilities in language models

- the sample space
- the events
- distributions

## Expected value

Discrete:

$$
E(X)=\sum_{x \in S} x P(x)
$$

Continuous:

$$
E(X)=\int_{a}^{b} x p(x) d x
$$

## Common discrete distributions

Uniform( n ) : $|S|=n, \mathrm{n}$ is finite

$$
P(X=x)=\frac{1}{n}
$$

## Common discrete distributions

Uniform( n ) : $|S|=n, \mathrm{n}$ is finite

$$
P(X=x)=\frac{1}{n}
$$

Bernoulli(p) : $p \in[0,1] ; X \in 0,1$ :

$$
P(X=1)=p ; P(X=0)=1-p
$$

## Common discrete distributions

Uniform( n ) : $|S|=n, \mathrm{n}$ is finite

$$
P(X=x)=\frac{1}{n}
$$

Bernoulli(p) : $p \in[0,1] ; X \in 0,1$ :

$$
P(X=1)=p ; P(X=0)=1-p
$$

Binomial(p,n) : $p \in[0,1] ; X \in 0,1, \ldots, n ; n \in \mathbb{N}$

$$
P(X=x)=\binom{n}{x} p^{x}(1-p)^{(n-x)}
$$

## Common discrete distributions

Uniform( n ) : $|S|=n, \mathrm{n}$ is finite

$$
P(X=x)=\frac{1}{n}
$$

Bernoulli(p) : $p \in[0,1] ; X \in 0,1$ :

$$
P(X=1)=p ; P(X=0)=1-p
$$

$\operatorname{Binomial}(\mathrm{p}, \mathrm{n}): p \in[0,1] ; X \in 0,1, \ldots, n ; n \in \mathbb{N}$

$$
P(X=x)=\binom{n}{x} p^{x}(1-p)^{(n-x)}
$$

$\operatorname{Multinomial}\left(p_{1}, \ldots, p_{k} ; x_{1}, \ldots, x_{k} ; n\right): \sum_{i} x_{i}=n$

$$
P\left(X_{1}=x_{1}, \ldots, X_{k}=x_{k}\right)=\frac{n!}{x_{1}!\ldots x_{k}!} p_{1}^{x_{1}} \ldots p_{k}^{x_{k}}
$$

## Common continuous distributions

$$
P(X \leq x)=\int_{-\infty}^{x} p(y) d y
$$

## Common continuous distributions

$$
P(X \leq x)=\int_{-\infty}^{x} p(y) d y
$$

Uniform $(a, b): a, b \in \mathbb{R}, a<b, X \in[a, b]$

$$
p(x)=\frac{1}{b-a}
$$

## Common continuous distributions

$$
P(X \leq x)=\int_{-\infty}^{x} p(y) d y
$$

Uniform $(\mathrm{a}, \mathrm{b}): a, b \in \mathbb{R}, a<b, X \in[a, b]$

$$
p(x)=\frac{1}{b-a}
$$

$\operatorname{Beta}(\alpha, \beta): \alpha, \beta \in \mathbb{R}_{++}, X \in[0,1]$

$$
p(x ; \alpha, \beta)=\frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha) \Gamma(\beta)} x^{\alpha-1}(1-x)^{\beta-1}
$$

## Common continuous distributions

$$
P(X \leq x)=\int_{-\infty}^{x} p(y) d y
$$

Uniform $(\mathrm{a}, \mathrm{b}): a, b \in \mathbb{R}, a<b, X \in[a, b]$

$$
p(x)=\frac{1}{b-a}
$$

$\operatorname{Beta}(\alpha, \beta): \alpha, \beta \in \mathbb{R}_{++}, X \in[0,1]$

$$
p(x ; \alpha, \beta)=\frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha) \Gamma(\beta)} x^{\alpha-1}(1-x)^{\beta-1}
$$

Dirichlet $(\alpha)$ : generalization of $\operatorname{Beta}(\alpha, \beta)$

## Common continuous distributions

$$
P(X \leq x)=\int_{-\infty}^{x} p(y) d y
$$

Uniform $(\mathrm{a}, \mathrm{b}): a, b \in \mathbb{R}, a<b, X \in[a, b]$

$$
p(x)=\frac{1}{b-a}
$$

$\operatorname{Beta}(\alpha, \beta): \alpha, \beta \in \mathbb{R}_{++}, X \in[0,1]$

$$
p(x ; \alpha, \beta)=\frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha) \Gamma(\beta)} x^{\alpha-1}(1-x)^{\beta-1}
$$

Dirichlet $(\alpha)$ : generalization of $\operatorname{Beta}(\alpha, \beta)$
$\operatorname{Normal}\left(\mu, \sigma^{2}\right): \mu \in \mathbb{R}, \sigma \in \mathbb{R}_{++}, X \in \mathbb{R}$

$$
p(x)=\frac{1}{\sigma \sqrt{2 \pi}} e^{-\frac{(x-\mu)^{2}}{2 \sigma^{2}}}
$$

Test

## Test

Two random variables thought they were discrete but I heard them continuously.
